Gene AI Log Entries

Task: Filling in knowledge for ReadMe
Purpose: Used to parse through repo in order to find any unknown technologies/development environments used by fellow partners, as I only recognized Angular, TypeScript, Node, SQLite, and github actions. Other purpose was to ensure the original command list was correctly ordered and written out, since everything wasnt fully put together yet. All i knew for the backend was:
- cd backend
- nvm use
- npm install
- npm tests

and therefore I let claude run through the rest to generate basic environment setup commands while the other features remain in branches.
Link: https://claude.ai/share/d46a6db7-f6a4-44d2-98ea-5d1c1d8d49dc
AI Generated: Other development tech used by teammates: namely Express5, JWT, Bcrypt. Others were named, however I deemed overly bloated or unnessecary for the Readme. As for setup I had a very fragmented and noncohesive set of setup commands, so ensuring that they were correct and ordered correct. Alongside my own simplification/interpretation being reinserted into the chat(as seen in the chat with “can i simplify most of this instruction set to”, in which i used the next generated prompt)
Validation: Manual review followed by Teammate review. I dont really use AI results in text entirely as its very bloated with extra explanations, words meanings, and small details. The most salient parts were taken out to be used in the readme (final 7 command lists, alongside parts of technologies found)
