

## AI Interaction Log

**Author:** Bryce **Date:** 2026-09-25 **AI Tool:** Claude (Cowork)

### Task / Prompt

Rewrite the existing AI log entries in `AI-log/Bryce/` so they align with the log format defined in the project instructions.

### Context / Findings

- Five entries existed. Four used an older “Conversation Log / AI Usage Log Entry” format (Theme, Responsible Person, Task ID, Purpose, Prompt, AI-Suggested Content, Validation): `database-schema-issue`, `database-issue-paste-ready`, `api-auth-issue-paste-ready`, and `migration-scripts-explained`.
- One entry, `move-ui-commit-off-main.md`, already matched the spec format and was left untouched.
- Target format: header (Author / Date / AI Tool) then sections **## Task / Prompt**, **## Context / Findings**, **## AI Output / Actions**, **## Decision**, **## Reflection**.

### AI Output / Actions

- Reformatted the four non-conforming entries into the spec format, preserving the substantive content of each and remapping it onto the new sections.
- Left **Decision** and **Reflection** empty per instruction, so Bryce and the team can fill them in — except the pre-existing reflection Bryce had already written on the `migration-scripts` entry, which was kept as his own content.
- Left the already-conforming git entry unchanged.
- Wrote the updated files back to `AI-log/Bryce/` in the connected repo folder.

### Decision

**Bryce:** Accepted as-is due to being a non-critical change

### Reflection

**Bryce:** I did not specify a format in the `claude.md`, so Claude did not automatically use a standard format across chats. This reminded me that you should specify constraints to your AI agent whenever possible.
