

AI Interaction Log

Author: Bryce **Date:** 2026-09-27 **AI Tool:** Claude (Cowork)

Task / Prompt

Review PR #34 (“Weekly minutes document”, by GeneFeng1) and compare it against the referenced issue.

Context / Findings

- PR #34 (branch Weekly-Minutes-Documents -> main, 1 file, +31) has no `Closes #` keyword, but is linked to issue #27 (“[Task] Meeting minutes template and upkeep”) via the Development sidebar (timeline “connected” event), so it will close #27 on merge.
- Issue #27 asks for: (1) a minutes template covering attendance, decisions, action items, discussion; (2) minutes kept in a `docs/minutes` folder; DoD: template in repo + Sprint 1 meetings captured.
- The PR adds `WeeklyMinutes.md` at the repo root with Meeting #1 (24-09-2026): attendance, agenda, task distribution, branching convention, comms, TA meeting, upcoming tasks.

AI Output / Actions

- Assessment: good first minutes, content-complete for Meeting #1, but gaps vs #27:
 1. Location — file is at repo root; the issue asks for `docs/minutes/`.
 2. No separate reusable template (issue task #1); decisions/action items aren’t broken out as their own headings.
 3. Content nits: “Lucas” should be “Luca”; Gene’s line “Distributed Aid other’s. bugs problems.” is garbled; folder-name inconsistency (minutes say `AI_Log/`, repo uses `AI-log/`, spec says “AI Log”) — align across team.
- Process catch: the documented branch convention `feature/<name>-<task>` is not followed by any existing branch (database, backend-api, registration-login-ui, Weekly-Minutes- Documents) — reconcile the convention with practice.
- Recommendation: move into `docs/minutes/`, add a template block, fix name/typo, then merge.

Decision

Bryce: Passed the feedback to Gene rather than merging as-is — the main asks being to move the file into `docs/minutes/`, split out a reusable template, and fix the name/typo nits. Also flagged that our documented branch convention isn’t actually being followed, which is a team-wide thing to sort out.

Reflection

Bryce: Reviewing a docs PR is different from reviewing code, but it was still useful to check it against the actual issue rather than just eyeballing it. It surfaced some inconsistencies in how we’re naming things across the repo that are easy to miss until you line them up side by side.
