

AI Interaction Log

Author: Bryce **Date:** 2026-09-27 **AI Tool:** Claude (Cowork)

Task / Prompt

Fix all the issues found while reviewing PR #4 (backend API), and produce a stub to add to the PR commit description describing the fixes. (PR #3 was already merged into main.)

Context / Findings

- The repo's `.git` (on iCloud Drive) had a stale `.git/index.lock` that the sandbox could not remove ("Operation not permitted"), so in-place checkout/edit of the `backend-api` branch wasn't safe. Worked instead in a clean `git clone of origin/backend-api` (HEAD 378f51c) outside iCloud, then produced a patch.
- Issues addressed:
 1. Real bug — `UPLOAD_DIR` in `src/config.js` used `new URL(...).pathname`, which leaves percent-encoding in the path. A project path with a space (the team's own "Assignment 1" iCloud path) resolved to `.../Assignment%201/.../uploads`.
 2. `middleware.js` set `req.user.id = payload.sub` (a string), relying on SQLite type affinity to match INTEGER PKs.
 3. `JWT_SECRET` silently fell back to a dev placeholder even in production.

AI Output / Actions

- `src/config.js`: `UPLOAD_DIR` now uses `fileURLToPath(new URL('../uploads', import.meta.url))` (decodes the path; also Windows-safe). Added a guard that throws at startup if `NODE_ENV === 'production'` and `JWT_SECRET` is still the default.
- `src/middleware.js`: `req.user.id` now `Number(payload.sub)` so it is a real integer.
- Added `test/config.test.js`: a regression guard asserting the resolved `UPLOAD_DIR` contains no `%`. Verified it FAILS on the old `.pathname` code under a spaced path (`cc%20fix%20spaced`) and PASSES with the fix.
- Full suite: 7/7 tests pass (6 original + new regression test).
- Deliberately left `POST /auth/logout` as a stateless client-side token discard — that matches issue #2's spec; a real server-side token blacklist is out of Sprint 1 scope.
- Delivered the changes as `cc-fix-pr4.patch` in the repo root (apply with `git apply`).

Decision

Bryce: Applied the patch and re-ran the tests to confirm all seven passed, including the new regression test for the upload path. Kept the stateless logout as-is since that matches the issue spec and a real token blacklist is out of scope for this sprint.

Reflection

Bryce: The `UPLOAD_DIR` bug was interesting because it only showed up thanks to our own iCloud path having a space in it — a good example of how an environment-specific thing can hide a real bug that the tests miss when they override the value. I hadn't run into `fileURLToPath` vs `.pathname` before.
