

AI Interaction Log

Author: Bryce **Date:** 2026-09-27 **AI Tool:** Claude (Cowork)

Task / Prompt

Delete the old user-story issues (US-01..US-17) and replace them with the 10 approved user stories from AI-log/Zohair/Zohair AI LOG.pdf. Assign Mahmoud (MahmoudAbdalla28) and Gabriel (gabibdods) to all 10; add Bryce (bryceorchard) to the AI story.

Context / Findings

- Read Zohair's AI log PDF (Task #28): 10 AI-generated user stories, validated against the Sprint 1 project doc and accepted by the team. US-10 is the mandatory AI feature (AI-assisted resume feedback).
- The old user stories were issues #5-#21 (17 `user-story`-labelled issues from the earlier bulk script).

AI Output / Actions

- Produced `replace-user-stories.sh`:
 - deletes issues #5-#21 (`gh issue delete --yes`; header notes the reversible `close` alternative since deletion is permanent),
 - creates Zohair's 10 stories verbatim (US-01..US-10) with labels, acceptance criteria, and backend/frontend task breakdowns,
 - assigns MahmoudAbdalla28 + gabibdods to US-01..US-09, and adds bryceorchard on US-10.
- Noted to re-run `setup-sprint1-board.sh` afterward to add the new stories to the board and regenerate `appendix-a.md`.

Decision

Bryce: Ran the script to clear the old stories and create Zohair's ten approved ones. The delete went through but the create step errored partway, so the missing stories were finished off in a follow-up (see `fix-missing-user-stories`).

Reflection

Bryce: Good reminder that a script touching the live issue tracker is worth running carefully and verifying afterwards, since deletion is permanent. It worked out because the failure was a clean skip rather than corruption, but I'll be more cautious running bulk operations like this in the future.
