

AI Interaction Log

Author: Bryce **Date:** 2026-09-27 **AI Tool:** Claude (Cowork)

Task / Prompt

Using the team role breakdown (from Discord) and the Sprint 1 project outline, create the next set of GitHub issues for the CareerConnect repo.

Context / Findings

- Read the Sprint 1 outline (SOEN341_CareerConnect_Project_Sprint1.docx). Key requirements: minimum 15 user stories as GitHub Issues with associated tasks and labels; plus GitHub setup, README, sprint planning, team process (DoR/DoD), AI usage log, meeting minutes, and a demo of two basic features. Rubric weights User Stories (3.0) and Sprint Planning (3.0) most heavily.
- Existing issues #1 (DB schema) and #2 (backend API) already cover the auth/profile/resume backend, so the new set references them rather than duplicating.
- Team roles: Bryce (scrum lead/process), Gene (docs), Zohair (requirements), Mahmoud/@meh (backend), Gabriel (frontend), Luca (integration & QA).
- Chosen approach (confirmed with Bryce): full Sprint 1 set, delivered as a runnable `gh issue create` script.

AI Output / Actions

- Produced `create-sprint1-issues.sh`: a GitHub CLI script that
 - creates the label set (type / area / priority / sprint) and a “Sprint 1” milestone,
 - creates 17 user stories (US-01..US-17) covering the whole CareerConnect backlog — Sprint 1 stories for auth/profile/resume (tied to #1/#2, frontend tasks to Gabriel) and backlog stories for job posting, search, apply, status tracking, dashboard, saved jobs, notifications, recruiter flows, and two AI features,
 - creates 12 process/docs/QA task issues mapped to owners (GitHub setup, team process, sprint plan + Appendix A, README, submission doc, minutes, AI-generated stories log, team-generated stories, AI Log structure, CI, tests, demo prep).
- Assignees are variables at the top of the script (only bryceorchard known); blank ones create issues unassigned. Backlog stories intentionally unassigned.
- Script is idempotent for labels/milestone; issue creation should be run once.

Decision

Bryce: Went with the full Sprint 1 set delivered as a runnable `gh` script. Left the backlog stories unassigned on purpose and kept the assignee handles as variables at the top so they’re easy to fill in. Ran the issue creation once since it isn’t idempotent.

Reflection

Bryce: Grounding the issues in the actual rubric weighting (user stories and sprint planning being the heaviest) helped me prioritise what to get right. Turning the whole backlog into structured issues with labels and tasks was a useful exercise in breaking the project down.
