# AI Interaction Log

**Author:** Luca **Date:** 2026-09-27 **AI Tool:** Claude (Cowork)

## Task / Prompt

Summary: “How do I set up CI with GitHub Actions for our Node backend?”

## Purpose of AI Use

Implementation (CI configuration) and learning

## Context / Findings

- Backend is Node.js (22-24) + Express 5, SQLite (better-sqlite3), bcryptics, JWT, and multer.
- Tests use Node’s built-in test runner + supertest (`npm test -> node --test test/*.test.js`).
- package.json, package-lock.json and test/ are all inside `backend/` on main.

## AI Output / Actions

- Explained what CI is and that GitHub Actions runs workflows defined in a YAML file.
- Generated `.github/workflows/ci.yml`: on push/PR to main, checks out code, installs Node 22 with npm caching, runs `npm ci` and `npm test` in `backend/`.
- Gave step-by-step instructions to create the file on a new branch via the GitHub website and open a PR.
- Suggested enabling branch protection on main requiring the CI check to pass.

## Validation

- Checked the file paths against the actual repo layout before creating the file.
- Opened the PR; the CI check ran and passed (green check).
- Opened the job logs to confirm the tests actually executed and passed.

## Decision

Accepted. Workflow used as generated.

## Reflection

Useful. I had no prior CI experience and it got working on the first try. Checking the repo layout first (where package.json and tests live) avoided path errors. Learned that workflows must live in `/github/workflows/` at the repo root.

## Evidence

Key prompts: - “Let’s start from scratch with CI, where do I begin?” - “Is creating a yml file and using GitHub Actions the same thing?” Generated yml file is in the repo at `.github/workflows/ci.yml`.
